## Recurrence relation

A recurrence relation is a formula which defines a sequence of numbers by telling you how to get to the next term of the sequence from previous ones.

For instance, the Fibonacci numbers $F(n)$ are defined by the recurrence relation

$$
\begin{gathered}
F(n)=F(n-1)+F(n-2) \\
F(1)=F(2)=1,
\end{gathered}
$$

which says that each number in the sequence is equal to the sum of the two previous ones, and also gives the starting values.

Similarly, the sequence of powers of 2 can be defined by

$$
\begin{aligned}
a_{n+1} & =2 a_{n} \\
a_{0} & =1 .
\end{aligned}
$$

Sometimes we can find ways to turn a recurrence relation into an ordinary formula which gives the $n$th term in terms of $n$, but this is not always easy. For the powers of 2 example, $a_{n}=2^{n}$, but a formula for the $n$th Fibonacci number is harder to obtain.
